No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Some alleles of this gene cause a predisposition to cancer, particularly prostate cancer. This gene and its protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic cools (both for cancer sufferers and those with a predisposition to the disease) and in the production of cancer drugs. This sequence was isolated by cloning and sequencing the region of the genome which appeared to cause a predisposition to prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim

It belongs to a family showing sequence similarity to a sulphatase from the marine bacterium Alteromonas carrageenovora. The hSG gene contains 23 exons and is located at chromosome 17p11.2. The present sequence is clone lambda29.1 from a human testes cDNA library. It was isolated using human EST sequences with sequence similarity to the non-CTPSR family as a probe to screen the library. The cDNA insert was subcloned and the DNA sequence of both strands was determined. The sequence may be used to treat a patient suffering from hSG deficiency by replacing, repairing, or compensating for a DNA sequence within the patient's genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim

                                                                                                                                                                                                                   õ
                                                                                                                                                                                                                                      CC AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, CC which represent the human ORFX open reading frames 1 to 3161 The ORFX CC sequences have activities such as: cytostatic; hepatotropic; vulnerary; CC antipsoriatic; antiparkinsonian; nootropic; neuroprotective; CC antipsoriatic; antiparkinsonian; notropic; neuroprotective; cantidiabetic; hypotensive; dermatological; immunosuppressive; CC antidiabetic; hypotensive; dermatological; influences; antirheumatic; CC antidiabetic; hypotensive; dermatological; antifungal; antirheumatic; CC antidiabetic; hypotensive; dermatological; influences for determining CC the presence of or predisposition to, or preventing or treating CC pathological conditions associated with an ORFX-associated disorder. The CC nucleic acids can be used to express ORFX proteins in gene therapy CC vectors. The proteins and nucleic acids may be used to treat cancers, CC proliferative disorders, neurodegenerative disorders, osteoarthritis, CC proliferative disorders, cardiovascular disease, diabetes mellitus, CC proteinsion, hypothyroidism, cholesterol ester storage, systemic lupus CC erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, CC bacterial or fungal infection, malaria, autoimmune disorders, asthma, CC allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                       Query Match
